General Marking Guidance

- All candidates must receive the same treatment. Examiners must mark the first candidate in exactly the same way as they mark the last.
- Mark schemes should be applied positively. Candidates must be rewarded for what they have shown they can do rather than penalised for omissions.
- Examiners should mark according to the mark scheme not according to their perception of where the grade boundaries may lie.
- There is no ceiling on achievement. All marks on the mark scheme should be used appropriately.
- All the marks on the mark scheme are designed to be awarded. Examiners should always award full marks if deserved, i.e. if the answer matches the mark scheme. Examiners should also be prepared to award zero marks if the candidate's response is not worthy of credit according to the mark scheme.
- Where some judgement is required, mark schemes will provide the principles by which marks will be awarded and exemplification may be limited.
- When examiners are in doubt regarding the application of the mark scheme to a candidate's response, the team leader must be consulted.
- Crossed out work should be marked UNLESS the candidate has replaced it with an alternative response.

SOME GENERAL PRINCIPLES FOR CORE MATHS MARKING

(But the particular mark scheme always takes precedence)

Method mark for solving 3 term quadratic:

Question Number	Scheme
3(b)	**Factorising/Solving a quadratic equation is tested in Question 3(b).** **Method mark for solving a 3 term quadratic:** **1. Factorisation** $(x^2 + bx + c) = (x + p)(x + q)$, where $\lvert pq \rvert = \lvert c \rvert$, leading to $x = \ldots$ $(ax^2 + bx + c) = (mx \pm p)(nx \pm q)$, where $\lvert pq \rvert = \lvert c \rvert$ and $\lvert mn \rvert = \lvert a \rvert$, leading to $x = \ldots$ **2. Formula** Attempt to use correct formula (with values for *a*, *b* and *c*.) **3. Completing the square** Solving $x^2 + bx + c = 0$: $\left(x \pm \frac{b}{2}\right)^2 \pm q \pm c = 0$, $q \neq 0$, leading to $x = \ldots$

Use of a formula

Where a method involves using a formula that has been learnt, the advice given in recent examiners' reports is that the formula should be quoted first.
Normal marking procedure is as follows:
Method mark for quoting a correct formula and attempting to use it, even if there are mistakes in the substitution of values (but refer to the mark scheme first… the application of this principle may vary).
Where the formula is not quoted, the method mark can be gained by implication from correct working with values, but will be lost if there is any mistake in the working.

Answers without working

The rubric says that these may gain no credit. Individual mark schemes will give details of what happens in particular cases. General policy is that if it could be done "in your head", detailed working would not be required. Most candidates do show working, but there are occasional awkward cases and if the mark scheme does not cover this, please contact your team leader for advice.

Misreads

A misread must be consistent for the whole question to be interpreted as such.
These are not common. In clear cases, please deduct the first 2 A (or B) marks which would have been lost by following the scheme. (Note that 2 marks is the maximum misread penalty, but that misreads which alter the nature or difficulty of the question cannot be treated so generously and it will usually be necessary here to follow the scheme as written).
Sometimes following the scheme as written is more generous to the candidate than applying the misread rule, so in this case use the scheme as written.

Question 1 Notes

(a)	**B1**	Writes down $(9-10x)^{-\frac{1}{2}}$ or uses power of $-\dfrac{1}{2}$.
		This mark can be implied by a constant term of $(9)^{-\frac{1}{2}}$ or $\dfrac{1}{3}$.
	<u>**B1**</u>	$\underline{(9)^{-\frac{1}{2}}}$ or $\underline{\dfrac{1}{3}}$ outside brackets or $\dfrac{1}{3}$ as candidate's constant term in their binomial expansion.
	M1	Expands $(\ldots+kx)^{-\frac{1}{2}}$ to give any 2 terms out of 3 terms simplified or an un-simplified, $1+(-\frac{1}{2})(kx)$ or $(-\frac{1}{2})(kx)+\dfrac{(-\frac{1}{2})(-\frac{3}{2})}{2!}(kx)^2$ or $1+\ldots\ldots+\dfrac{(-\frac{1}{2})(-\frac{3}{2})}{2!}(kx)^2$, **where** $k \neq 1$.
	A1	$\dfrac{1}{3}+\dfrac{5}{27}x$ **(simplified fractions)**
	A1	Accept only $\dfrac{25}{162}x^2$

1. (a) ctd	**Note**	**You cannot recover correct work for part (a) in part (b).** i.e. if the correct answer to (a) appears as part of their solution in part (b), it cannot be credited in part (a).
	SC	If a candidate ***would otherwise score*** A0A0 then **allow Special Case 1st A1 for either**
		SC: $\frac{1}{3}\left[\ 1+\frac{5}{9}x;\ ...\ \right]$ or **SC**: $\lambda\left[\ 1+\frac{5}{9}x+\ \frac{25}{54}x^2+...\right]$ or **SC**: $\left[\ \lambda+\frac{5\lambda}{9}x+\ \frac{25\lambda}{54}x^2+...\right]$
		(where λ can be 1 or omitted), with each term in the $[.........]$ is a simplified fraction
	SC	**Special case for the M1 mark**
		Award Special Case M1 for a correct simplified or un-simplified $1+n(kx)+\frac{n(n-1)}{2!}(kx)^2$ expansion with a value of $n\neq-\frac{1}{2}$, $n\neq$ ***positive integer*** and a consistent (kx). Note that (kx) must be consistent (on the RHS, not necessarily the LHS) in a candidate's expansion.
		Note that $k\neq1$.
	Note	Candidates who write $\left\{\frac{1}{3}\right\}\left[\ 1+\left(-\frac{1}{2}\right)\left(\frac{10x}{9}\right)+\frac{(-\frac{1}{2})(-\frac{3}{2})}{2!}\left(\frac{10x}{9}\right)^2+...\ \right]$
		where $k=\frac{10}{9}$ and not $-\frac{10}{9}$ and achieve $\frac{1}{3}-\frac{5}{27}x;+\ \frac{25}{162}x^2+...$ will get B1B1M1A0A1.
(b)		
	M1	Writes down $(3+x)($their part (a) answer, at least 2 of the 3 terms.$)$
	Note	$(3+x)\left(\frac{1}{4}+\frac{5}{4}x+\ ...\right)$ or $(3+x)\left(\frac{1}{3}+\frac{5}{27}x+\ \frac{25}{162}x^2+...\right)$ are fine for M1.
	Note	This mark can also be implied by candidate multiplying out to find two terms (or coefficients) in x.
	M1	Multiplies out to give exactly one constant term, exactly 2 terms in x and exactly 2 terms in x^2.
	Note	This M1 mark can be implied. You can also ignore x^3 terms.
	A1	$1+\frac{8}{9}x+\ \frac{35}{54}x^2+...$

Alternative Methods for part (a)

Alternative method 1: Candidates can apply an alternative form of the binomial expansion.

$$\left\{\frac{1}{\sqrt{(9-10x)}}=\right\}\ (9-10x)^{-\frac{1}{2}}=(9)^{-\frac{1}{2}}+\left(-\frac{1}{2}\right)(9)^{-\frac{3}{2}}(-10x)+\frac{(-\frac{1}{2})(-\frac{3}{2})}{2!}(9)^{-\frac{5}{2}}(-10x)^2$$

B1	Writes down $(9-10x)^{-\frac{1}{2}}$ or uses power of $-\frac{1}{2}$.
B1	$9^{-\frac{1}{2}}$ or $\frac{1}{3}$
M1	Any two of three (un-simplified or simplified) terms correct.
A1	$\frac{1}{3}+\frac{5}{27}x$
A1	$\frac{25}{162}x^2$
Note	The terms in C need to be evaluated, so ${}^{-\frac{1}{2}}C_0(9)^{-\frac{1}{2}}+{}^{-\frac{1}{2}}C_1(9)^{-\frac{3}{2}}(-10x)+{}^{-\frac{1}{2}}C_2(9)^{-\frac{5}{2}}(-10x)^2$ without further working is B1B0M0A0A0.

3.	$x^2 + y^2 + 10x + 2y - 4xy = 10$

	$2x + 10 - 4y + (2y + 2 - 4x)\frac{dy}{dx} = 0$ **Dependent on the first M1 mark.**	dM1
	$\frac{dy}{dx} = \frac{2x + 10 - 4y}{4x - 2y - 2}$	
	Simplifying gives $\frac{dy}{dx} = \frac{x + 5 - 2y}{2x - y - 1}$ $\left\{= \frac{-x - 5 + 2y}{-2x + y + 1}\right\}$	A1 **cso oe**
		[5]
(b)	$\left\{\frac{dy}{dx} = 0 \Rightarrow\right\}$ $x + 5 - 2y = 0$	M1
	So $x = 2y - 5$,	
	$(2y - 5)^2 + y^2 + 10(2y - 5) + 2y - 4(2y - 5)y = 10$	M1
	$4y^2 - 20y + 25 + y^2 + 20y - 50 + 2y - 8y^2 + 20y = 10$	
	gives $-3y^2 + 22y - 35 = 0$ or $3y^2 - 22y + 35 = 0$ $3y^2 - 22y + 35\ \{= 0\}$ **see notes**	A1 oe
	$(3y - 7)(y - 5) = 0$ and $y = ...$ Method mark for solving a quadratic equation.	ddM1

	<u>Alternative method for part (b)</u>	
(b)	$\left\{\frac{dy}{dx} = 0 \Rightarrow\right\}$ $x + 5 - 2y = 0$	M1
	So $y = \frac{x + 5}{2}$,	
	$x^2 + \left(\frac{x + 5}{2}\right)^2 + 10x + 2\left(\frac{x + 5}{2}\right) - 4x\left(\frac{x + 5}{2}\right) = 10$	M1
	$x^2 + \frac{x^2 + 10x + 25}{4} + 10x + x + 5 - 2x^2 - 10x = 10$	
	$4x^2 + x^2 + 10x + 25 + 40x + 4x + 20 - 8x^2 - 40x = 40$	
	gives $-3x^2 + 14x + 5 = 0$ or $3x^2 - 14x - 5 = 0$ $3x^2 - 14x - 5\ \{= 0\}$ **see notes**	A1 oe
	$(3x + 1)(x - 5) = 0$, $x = ...$ $y = \frac{-\frac{1}{3} + 5}{2}, \frac{5 + 5}{2}$ Solves a quadratic **and finds at least one value for *y*.**	ddM1

3. (a)	**M1**	Differentiates implicitly to include either $\pm 4x\dfrac{dy}{dx}$ or $y^2 \to 2y\dfrac{dy}{dx}$ or $2y \to 2\dfrac{dy}{dx}$. (Ignore $\left(\dfrac{dy}{dx} = \right)$).
	A1	$x^2 + y^2 + 10x + 2y \to 2x + 2y\dfrac{dy}{dx} + 10 + 2\dfrac{dy}{dx}$ **and** $10 \to 0$
	M1	$-4xy \to \pm 4y \pm 4x\dfrac{dy}{dx}$
	Note	If an extra term appears then award 1st A0.
	Note	$2x + 2y\dfrac{dy}{dx} + 10 + 2\dfrac{dy}{dx} - 4y - 4x\dfrac{dy}{dx} \to 2x + 10 - 4y = -2y\dfrac{dy}{dx} - 2\dfrac{dy}{dx} + 4x\dfrac{dy}{dx}$ will get 1st A1 (implied) as the $"=0"$ can be implied by rearrangement of their equation.
	dM1	**dependent on the first method mark being awarded.** An attempt to factorise out **all the terms in** $\dfrac{dy}{dx}$ as long as there are ***at least two terms*** in $\dfrac{dy}{dx}$.
	A1	$\dfrac{x + 5 - 2y}{2x - y - 1}$ or $\dfrac{-x - 5 + 2y}{-2x + y + 1}$ (must be simplified).
	cso:	If the candidate's solution is not completely correct, then do not give this mark.
(b)	**M1**	Sets the numerator of their $\dfrac{dy}{dx}$ equal to zero (or the denominator of their $\dfrac{dx}{dy}$ equal to zero) oe.
	NOTE	**If the numerator involves one variable only then *only* the 1st M1 mark is possible in part (b).**
	M1	Substitutes their x or their y into the printed equation to give an equation in one variable only.
	A1	For obtaining either $-3y^2 + 22y - 35\ \{=0\}$ or $3y^2 - 22y + 35\ \{=0\}$
	Note	This mark can also awarded for a correct three term equation, eg. either $-3y^2 + 22y = 35$ $3y^2 - 22y = -35$ or $3y^2 + 35 = 22y$ are all fine for A1.
	ddM1	**Dependent on the previous 2 M marks.** **See notes at the beginning of the mark scheme: Method mark for solving a 3 term quadratic** • $(3y-7)(y-5) = 0 \Rightarrow y = ...$ • $y = \dfrac{22 \pm \sqrt{(-22)^2 - 4(3)(35)}}{2(3)}$ • $y^2 - \dfrac{22}{3}y - \dfrac{35}{3} = 0 \Rightarrow \left(y - \dfrac{11}{3}\right)^2 - \dfrac{121}{9} + \dfrac{35}{3} = 0 \Rightarrow y = ...$ • Or writes down at least one correct y- root from their quadratic equation. This is usually found from their calculator.
	Note	If a candidate applies ***the alternative method*** then they also need to use their $y = \dfrac{x+5}{2}$ in order to find **at least one value** for y in order to gain the final M1.
	A1	$y = \dfrac{7}{3}, 5$. **cao.** (2.33 or 2.3 without reference to $\dfrac{7}{3}$ or $2\dfrac{1}{3}$ is not allowed for this mark.)
	Note	It is possible for a candidate who does not achieve full marks in part (a), (but has a correct numerator for $\dfrac{dy}{dx}$) to gain all 5 marks in part (b).

		Question 4 Notes
4. (a)		**BE CAREFUL!** Candidates will assign ***their own*** "*A*, *B* and *C*" for this question.
	B1	At least one of "*B*" or "*C*" are correct.
	B1	Breaks up their partial fraction correctly into three terms **and** both $"B" = 25$ and $"C" = 100$.
	Note	If a candidate does not give partial fraction decomposition then: • the 2nd B1 mark can follow from a correct identity.
	M1	Writes down ***a correct identity*** (although this can be implied) and attempts to find the value of either one of "*A*" or "*B*" or "*C*". This can be achieved by ***either*** substituting values into their identity ***or*** comparing coefficients and solving the resulting equations simultaneously.
	A1	Correct value for "*A*" which is found using a correct identity and follows from their partial fraction decomposition.
	Note	If a candidate does not give partial fraction decomposition then the final A1 mark can be awarded for a correct "*A*" if a candidate writes out their partial fractions at the end.
	Note	The correct partial fraction from no working scores B1B1M1A1.
	Note	A number of candidates will start this problem by writing out the correct identity and then attempt to find "*A*" or "*B*" or "*C*". Therefore the B1 marks can be awarded from this method.
	Note	Award SC B1B0M0A0 for $\dfrac{25}{x^2(2x+1)} \equiv \dfrac{B}{x^2} + \dfrac{C}{(2x+1)}$ leading to $"B" = 25$ **or** $"C" = 100$
(b)	**B1**	For a correct statement of $\pi\int\left(\dfrac{5}{x\sqrt{(2x+1)}}\right)^2$ or $\pi\int\dfrac{25}{x^2(2x+1)}$. Ignore limits and d*x*. Can be implied.
	Note	**The π can only be recovered later from a correct expression.**
		For their partial fraction, (not $\sqrt{\text{their partial fraction}}$), where *A*, *B*, *C* are "their" part (a) constants
	M1	Either $\pm\dfrac{A}{x} \to \pm a\ln x$ or $\pm\dfrac{B}{x^2} \to \pm b\,x^{-1}$ or $\dfrac{C}{(2x+1)} \to \pm c\ln(2x+1)$.
	Note	$\sqrt{\dfrac{B}{x^2}} \to \dfrac{\sqrt{B}}{x}$ which integrates to $\sqrt{B}\ln x$ is **not** worthy of M1.
	A1ft	At least two terms from any of $\pm\dfrac{A}{x}$ or $\pm\dfrac{B}{x^2}$ or $\dfrac{C}{(2x+1)}$ correctly integrated. Can be un-simplified.
	A1ft	All 3 terms from $\pm\dfrac{A}{x}$, $\pm\dfrac{B}{x^2}$ and $\dfrac{C}{(2x+1)}$ correctly integrated. Can be un-simplified.
	Note	The 1st A1 and 2nd A1 marks in part (b) are both follow through accuracy marks.
	dM1	**Dependent on the previous M mark.** Applies limits of 4 and 1 and subtracts the correct way round.
	A1	Final correct **exact** answer in the form $a + b\ln c$. i.e. either $\dfrac{75}{4}\pi + 50\pi\ln\left(\dfrac{3}{4}\right)$ or $50\pi\ln\left(\dfrac{3}{4}\right) + \dfrac{75}{4}\pi$ or $50\pi\ln\left(\dfrac{9}{12}\right) + \dfrac{75}{4}\pi$ or $\dfrac{75}{4}\pi - 50\pi\ln\left(\dfrac{4}{3}\right)$ or $\dfrac{75}{4}\pi + 25\pi\ln\left(\dfrac{9}{16}\right)$ etc. Also allow $\pi\left(\dfrac{75}{4} + 50\ln\left(\dfrac{3}{4}\right)\right)$ or equivalent.
	Note	A candidate who achieves full marks in (a), but then mixes up the correct constants when writing their partial fraction can only achieve a maximum of B1M1A1A0M1A0 in part (b).
	Note	The π in the volume formula is only required for the B1 mark and the final A1 mark.

	$k = \ln\left(\dfrac{7600}{3200}\right)$ or equivalent $\left\{\text{eg } k = \ln\left(\dfrac{19}{8}\right)\right\}$	At least one of $A = 9025$ cao or $k = \ln\left(\dfrac{7600}{3200}\right)$ or exact equivalent	A1
	$\left\{A = 3800(\mathrm{e}^{k}) = 3800\left(\dfrac{19}{8}\right) \Rightarrow\right\}\ A = 9025$	Both $A = 9025$ cao or $k = \ln\left(\dfrac{7600}{3200}\right)$ or exact equivalent	A1

		Question 7 Notes
7. (a)		
	B1	Separates variables as shown. dN and dt should be in the correct positions, though this mark can be implied by later working. Ignore the integral signs.
	M1	**Either** $\pm\lambda\ln(5000-N)$ or $\pm\lambda\ln(N-5000)$ **or** $kt-\ln t$ where $\lambda\neq 0$ is a constant.
	A1	For $-\ln(5000-N)=kt-\ln t$ or $\ln(5000-N)=-kt+\ln t$ or $-\frac{1}{k}\ln(5000-N)=t-\frac{1}{k}\ln t$ oe
	A1	**which is dependent on the 1st M1 mark being awarded.** For applying a constant of integration, eg. $+c$ or $+\ln e^c$ or $+\ln c$ or A to their integrated equation
	Note	$+c$ can be on either side of their equation for the 2nd A1 mark.
	A1	Uses a constant of integration eg. "c" or "$\ln e^c$" "$\ln c$" or and applies a fully correct method to prove the result $N=5000-Ate^{-kt}$ with no incorrect working seen. (Correct solution only.)
	NOTE	**IMPORTANT** There needs to be an intermediate stage of justifying the A **and** the e^{-kt} in Ate^{-kt} by for example • **either** $5000-N=e^{\ln t-kt+c}$ • **or** $5000-N=te^{-kt+c}$ • **or** $5000-N=te^{-kt}e^c$ or equivalent needs to be stated before achieving $N=5000-Ate^{-kt}$
(b)	**B1**	At least one of **either** $1200=5000-Ae^{-k}$ (or equivalent) **or** $1800=5000-2Ae^{-2k}$ (or equivalent)
	M1	• **Either** an attempt to eliminate A by producing an equation in only k. • **or** an attempt to eliminate k by producing an equation in only A
	A1	At least one of $A=9025$ cao or $k=\ln\left(\frac{7600}{3200}\right)$ or equivalent
	A1	Both $A=9025$ cao or $k=\ln\left(\frac{7600}{3200}\right)$ or equivalent
	Note	Alternative correct values for k are $k=\ln\left(\frac{19}{8}\right)$ or $k=-\ln\left(\frac{8}{19}\right)$ or $k=\ln 7600-\ln 3200$ or $k=-\ln\left(\frac{3800}{9025}\right)$ or equivalent.
	Note	$k=0.8649...$ without a correct exact equivalent is A0.
(c)	**B1**	anything that rounds to 4400

Question Number	Scheme		Marks
8.	$x = t - 4\sin t,\quad y = 1 - 2\cos t,\quad -\frac{2\pi}{3} \leqslant t \leqslant \frac{2\pi}{3}\quad A(k, 1)$ lies on the curve, $k > 0$		
(a)	$\{\text{When } y = 1,\}\ 1 = 1 - 2\cos t \Rightarrow t = -\frac{\pi}{2}, \frac{\pi}{2}$ $k \text{ (or } x) = \frac{\pi}{2} - 4\sin\left(\frac{\pi}{2}\right)$ **or** $x = -\frac{\pi}{2} - 4\sin\left(-\frac{\pi}{2}\right)$	Sets $y = 1$ to find t and uses their t to find x.	M1
	$\left\{\text{When } t = -\frac{\pi}{2}, k > 0,\right\}$ so $k = 4 - \frac{\pi}{2}$ or $\frac{8-\pi}{2}$	x or $k = 4 - \frac{\pi}{2}$	A1
			[2]
(b)	$\frac{dx}{dt} = 1 - 4\cos t,\quad \frac{dy}{dt} = 2\sin t$	At least one of $\frac{dx}{dt}$ or $\frac{dy}{dt}$ correct.	B1
		Both $\frac{dx}{dt}$ and $\frac{dy}{dt}$ are correct.	B1
	So, $\frac{dy}{dx} = \frac{2\sin t}{1 - 4\cos t}$	Applies their $\frac{dy}{dt}$ divided by their $\frac{dx}{dt}$ and substitutes their t into their $\frac{dy}{dx}$.	M1;
	At $t = -\frac{\pi}{2},\ \frac{dy}{dx} = \frac{2\sin\left(-\frac{\pi}{2}\right)}{1 - 4\cos\left(-\frac{\pi}{2}\right)}$; $= -2$	Correct value for $\frac{dy}{dx}$ of -2	A1 **cao cso**
			[4]
(c)	$\frac{2\sin t}{1 - 4\cos t} = -\frac{1}{2}$	Sets their $\frac{dy}{dx} = -\frac{1}{2}$	M1
	gives $4\sin t - 4\cos t = -1$	**See notes**	A1
	So $4\sqrt{2}\sin\left(t - \frac{\pi}{4}\right)$;$= -1$ or $-4\sqrt{2}\cos\left(t + \frac{\pi}{4}\right)$;$= -1$	**See notes**	M1; A1
	$t = \sin^{-1}\left(\frac{-1}{4\sqrt{2}}\right) + \frac{\pi}{4}$ or $t = \cos^{-1}\left(\frac{1}{4\sqrt{2}}\right) - \frac{\pi}{4}$	**See notes**	dM1
	$t = 0.6076875626... = 0.6077$ (4 dp)	anything that rounds to 0.6077	A1
			[6] **12**

	Question 8 Notes	
(c)	**NOTE**	**<u>VERY IMPORTANT NOTE FOR PART (c)</u>** Candidates who state $t = 0.6077$ with no intermediate working from $4\sin t - 4\cos t = -1$ will get 2nd M0, 2nd A0, 3rd M0, 3rd A0. They will not express $4\sin t - 4\cos t$ as either $4\sqrt{2}\sin\left(t - \frac{\pi}{4}\right)$ or $-4\sqrt{2}\cos\left(t + \frac{\pi}{4}\right)$. OR use any acceptable alternative method to achieve $t = 0.6077$
	NOTE	Alternative methods for part (c) are given on the next page.

	Question 8: Alternative Methods for Part (c)		
8. (c)	**Alternative Method 1:**		
	$\dfrac{2\sin t}{1-4\cos t} = -\dfrac{1}{2}$	Sets their $\dfrac{dy}{dx} = -\dfrac{1}{2}$	M1
	eg. $\left(\dfrac{2\sin t}{1-4\cos t}\right)^2 = \dfrac{1}{4}$ or $(4\sin t)^2 = (4\cos t - 1)^2$ or $(4\sin t + 1)^2 = (4\cos t)^2$ etc.	Squaring to give a correct equation. This mark can be implied by a "squared" correct equation.	A1
		Note: You can also give 1st A1 in this method for $4\sin t - 4\cos t = -1$ as in the main scheme.	
		Squares their equation, applies $\sin^2 t + \cos^2 t = 1$ and achieves a **three term quadratic equation** of the form $\pm a\cos^2 t \pm b\cos t \pm c = 0$ or $\pm a\sin^2 t \pm b\sin t \pm c = 0$ or eg. $\pm a\cos^2 t \pm b\cos t = \pm c$ where $a \neq 0, b \neq 0$ and $c \neq 0$.	M1
	• **Either** $32\cos^2 t - 8\cos t - 15 = 0$ • **or** $32\sin^2 t + 8\sin t - 15 = 0$	For a correct **three term quadratic equation.**	A1
	• **Either** $\cos t = \dfrac{8 \pm \sqrt{1984}}{64} = \dfrac{1+\sqrt{31}}{8} \Rightarrow t = \cos^{-1}(...)$ • **or** $\sin t = \dfrac{-8 \pm \sqrt{1984}}{64} = \dfrac{-1 \pm \sqrt{31}}{8} \Rightarrow t = \sin^{-1}(...)$	**which is dependent on the 2nd M1 mark.** Uses correct algebraic processes to give $t = ...$	dM1
	$t = 0.6076875626... = 0.6077$ (4 dp)	anything that rounds to 0.6077	A1
			[6]
8. (c)	**Alternative Method 2:**		
	$\dfrac{2\sin t}{1-4\cos t} = -\dfrac{1}{2}$	Sets their $\dfrac{dy}{dx} = -\dfrac{1}{2}$	M1
	eg. $(4\sin t - 4\cos t)^2 = (-1)^2$	Squaring to give a correct equation. This mark can be implied by a correct equation. **Note:** You can also give 1st A1 in this method for $4\sin t - 4\cos t = -1$ as in the main scheme.	A1
	So $16\sin^2 t - 32\sin t\cos t + 16\cos^2 t = 1$ leading to $16 - 16\sin 2t = 1$	Squares their equation, applies both $\sin^2 t + \cos^2 t = 1$ and $\sin 2t = 2\sin t\cos t$ and then achieves an equation of the form $\pm a \pm b\sin 2t = \pm c$	M1
		$16 - 16\sin 2t = 1$ or equivalent.	A1
	$\left\{\sin 2t = \dfrac{15}{16} \Rightarrow\right\}\ t = \dfrac{\sin^{-1}(....)}{2}$	**which is dependent on the 2nd M1 mark.** Uses correct algebraic processes to give $t = ...$	dM1
	$t = 0.6076875626... = 0.6077$ (4 dp)	anything that rounds to 0.6077	A1
			[6]

		Question 8 Notes
8. (a)	**M1**	Sets $y=1$ to find t and uses their t to find x.
	Note	M1 can be implied by either x or $k = 4 - \frac{\pi}{2}$ or 2.429... or $\frac{\pi}{2} - 4$ or $-2.429...$
	A1	x or $k = 4 - \frac{\pi}{2}$ or $\frac{8-\pi}{2}$
	Note	A decimal answer of 2.429... (without a correct **exact** answer) is A0.
	Note	Allow A1 for a candidate using $t = \frac{\pi}{2}$ to find $x = \frac{\pi}{2} - 4$ **and** then stating that k must be $4 - \frac{\pi}{2}$ o.e.
(b)	**B1**	At least one of $\frac{\mathrm{d}x}{\mathrm{d}t}$ or $\frac{\mathrm{d}y}{\mathrm{d}t}$ correct. **Note:** that this mark can be implied from their working.
	B1	Both $\frac{\mathrm{d}x}{\mathrm{d}t}$ and $\frac{\mathrm{d}y}{\mathrm{d}t}$ are correct. **Note:** that this mark can be implied from their working.
	M1	Applies their $\frac{\mathrm{d}y}{\mathrm{d}t}$ divided by their $\frac{\mathrm{d}x}{\mathrm{d}t}$ **and** attempts to substitute their t into their expression for $\frac{\mathrm{d}y}{\mathrm{d}x}$.
	Note	This mark may be implied by their final answer. i.e. $\frac{\mathrm{d}y}{\mathrm{d}x} = \frac{2\sin t}{1 - 4\cos t}$ followed by an answer of -2 (from $t = -\frac{\pi}{2}$) or 2 (from $t = \frac{\pi}{2}$)
	Note	**Applying** $\frac{\mathrm{d}x}{\mathrm{d}t}$ divided by their $\frac{\mathrm{d}y}{\mathrm{d}t}$ is M0, even if they state $\frac{\mathrm{d}y}{\mathrm{d}x} = \frac{\mathrm{d}y}{\mathrm{d}t} \div \frac{\mathrm{d}x}{\mathrm{d}t}$.
	A1	Using $t = -\frac{\pi}{2}$ $\left(\text{and not } t = \frac{3\pi}{2}\right)$ to find a correct $\frac{\mathrm{d}y}{\mathrm{d}x}$ of -2 ***by correct solution only.***
(c)		
	NOTE	If a candidate uses an incorrect $\frac{\mathrm{d}y}{\mathrm{d}x}$ expression in part (c) then the accuracy marks are not obtainable.
	1st M1	Sets their $\frac{\mathrm{d}y}{\mathrm{d}x} = -\frac{1}{2}$
	1st A1	Rearranges to give the correct equation with $\sin t$ and $\cos t$ **on the same side.** eg. $4\sin t - 4\cos t = -1$ or $4\cos t - 4\sin t = 1$ or $\sin t - \cos t = -\frac{1}{4}$ or $\cos t - \sin t = \frac{1}{4}$ or $4\sin t - 4\cos t + 1 = 0$ or $4\cos t - 4\sin t - 1 = 0$ or $\sin t - \cos t + \frac{1}{4} = 0$ etc. are fine for A1.
	2nd M1	Rewrites $\pm\lambda\sin t \pm \mu\cos t$ in the form of either $R\cos(t \pm \alpha)$ or $R\sin(t \pm \alpha)$ where $R \neq 1$ or 0 and $\alpha \neq 0$
	2nd A1	Correct equation. Eg. $4\sqrt{2}\sin\left(t - \frac{\pi}{4}\right) = -1$ or $-4\sqrt{2}\cos\left(t + \frac{\pi}{4}\right) = -1$ or $\sqrt{2}\sin\left(t - \frac{\pi}{4}\right) = -\frac{1}{4}$ or $\sqrt{2}\cos\left(t + \frac{\pi}{4}\right) = \frac{1}{4}$, etc.
	Note	Unless recovered, give A0 for $4\sqrt{2}\sin\left(t - 45^\circ\right) = -1$ or $-4\sqrt{2}\cos\left(t + 45^\circ\right) = -1$, etc.
	3rd M1	**which is dependent on the 2nd M1 mark.** Uses correct algebraic processes to give $t = ...$
	4th A1	anything that rounds to 0.6077
	Note	**Do not give** the final A1 mark in (c) if there any extra solutions given in the range $-\frac{2\pi}{3} \leqslant t \leqslant \frac{2\pi}{3}$.
	Note	You can give the final A1 mark in (c) if extra solutions are given outside of $-\frac{2\pi}{3} \leqslant t \leqslant \frac{2\pi}{3}$.
